

Abstract

This paper presents a deep learning method for crop classification using Sentinel-2 satellite imagery combined w

Introduction

Precision agriculture increasingly relies on remote sensing data to monitor crop health at scale across large farm

Methodology

We trained a convolutional neural network on labeled parcels covering wheat, maize and soybean fields across t

Results

Our model achieves 91.5 percent overall classification accuracy on the held-out test set, outperforming traditiona

Conclusion

Combining satellite and UAV imagery significantly improves crop classification accuracy compared to using sate
